

# The 64 causal types in a mediation model

In a  $X \rightarrow M \rightarrow Y \leftarrow X$  model in which  $X$  can affect  $Y$  directly or indirectly through  $M$ , all nodes binary, there are:

- 4 types for  $M$  (4 ways that  $M$ 's values could be determined, given  $X$ )
- 16 types for  $Y$  (16 ways that  $Y$ 's values could be determined, given  $X$  and  $M$ )
- 64 distinct causal types, capturing all the different ways that  $X$  could cause  $Y$  directly or indirectly through  $M$

The table below shows all 64 types and how to interpret them.

Y when				M when				
				M.00	M.01	M.10	M.11	
				X = 0	0	0	1	
				X = 1	0	1	0	
X = 0, M = 0	X = 1, M = 0	X = 0, M = 1	X = 1, M = 1
